Mosquito
Beater.
Treat your yard
now and enjoy.

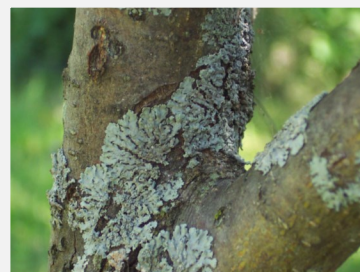

INSECT PROBLEMS

Aphids-These soft bodied insects repro-
duce very rapidly. They cause distorted
leaves and exude a honeydew causing
sooty mold to grow. You must spray every
7 days with an insecticide.

Sooty Mold-This black colored fungus
grows on the dew secreted by aphids.
Sooty mold is an aesthetic problem and
doesn't harm the plant. You have to treat
your insect problem first then apply a sys-
temic to prevent it from happening.

Lichen-A combination of an alga and a
fungus growing in patches. Lichen grows
on stagnant plants & trees that are not ac-
tively growing. It is not extremely harmful
to the plant but is a sign of lack of fertiliz-
er. We recommend using a 12.6.6.

Scale-A small insect that feeds by sucking
sap from plants weakening plants and
eventually killing them. It can cause yel-
lowing, stunted growth and dead leaves.
Trim the infected areas and spray with an
insecticide or dormant oil.

White Flies-These are unsightly and de-
structive pests. White flies cause yellowing,
mold, poor growth. They reproduce and
spread quickly, requiring prompt attention.
Apply insecticidal soap in the early morn-
ing or late evening every few days.
