Same great product, lower price.

Sienna (red), & Chestnut (brown) available in this size.

Golden still available in 2 Cu.

In Stock!!!
Mosquito Beater.
Treat your yard now and enjoy.

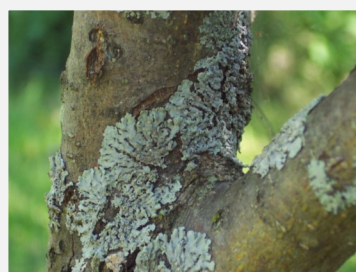

INSECT PROBLEMS

Worms and Caterpillars-These insects can defoliate plants quickly. Typical on azaleas but can also spread to other plants. We recommend using Thuricide. Apply at least 2 applications 7 days apart.

Sooty Mold-This black colored fungus grows on the dew secreted by aphids. Sooty mold is an aesthetic problem and doesn't harm the plant. You have to treat your insect problem first then apply a systemic to prevent it from happening.

Lichen-A combination of an algae and a fungus growing in patches. Lichen grows on stagnant plants & trees that are not actively growing. It is not extremely harmful to the plant but is a sign of lack of fertilizer. We recommend using a 12.6.6.

Scale-A small insect that feeds by sucking sap from plants weakening plants and eventually killing them. It can cause yellowing, stunted growth and dead leaves. Trim the infected areas and spray with an insecticide or dormant oil.

White Flies-These are unsightly and destructive pests. White flies cause yellowing, mold & poor growth. They reproduce and spread quickly, requiring prompt attention. Apply insecticidal soap in the early morning or late evening every few days.
